Project Title: Online Advertising Fraud Detection and Analytics System

Module Photographs:

Data Processing and Traffic Monitoring

- Clean the collected advertisement data by removing duplicate and incomplete records.
- Organize and format the data for easy analysis.
- Monitor advertisement traffic from different sources.
- Analyze user activity and traffic patterns.
- Prepare the processed data for fraud detection and reporting.

Project Description:

The **Online Advertising Fraud Detection and Analytics System** focuses on processing and monitoring online advertisement data to identify suspicious activities and understand advertising traffic patterns. In this module, the collected advertisement data is cleaned by removing duplicate, incomplete, and inconsistent records to improve data quality. The cleaned data is organized and formatted into a structured form for further analysis. The system monitors advertisement traffic from different sources such as websites, applications, and digital platforms. It analyzes user activities, clicks, impressions, and traffic patterns to identify unusual or potentially fraudulent behavior. The processed data is then prepared for fraud detection and reporting, helping to identify abnormal traffic and improve the reliability of online advertising analytics.
